

LEARN

# NGINX HTTP/3— Configurations, Troubleshooting, and Best Practices

HTTP/3, the latest version of the Hypertext Transfer Protocol, improves upon its predecessor by utilizing QUIC, a transport layer network protocol based on UDP. This shift addresses issues like connection reliability, latency, and security inherent in HTTP/2 and HTTP/1.1.

NGINX, a popular web server and reverse proxy, offers HTTP/3 support through its `ngx_http_v3_module`. Although an experimental feature at the time of writing, this introduces a significant step in web technology advancement. It aims to combine NGINX's performance and versatility with HTTP/3's advanced features.

This article explores NGINX HTTP/3 configurations, best practices, and troubleshooting.

## Summary of key NGINX HTTP/3 concepts

We use cookies to improve your experience. [Learn more](#)

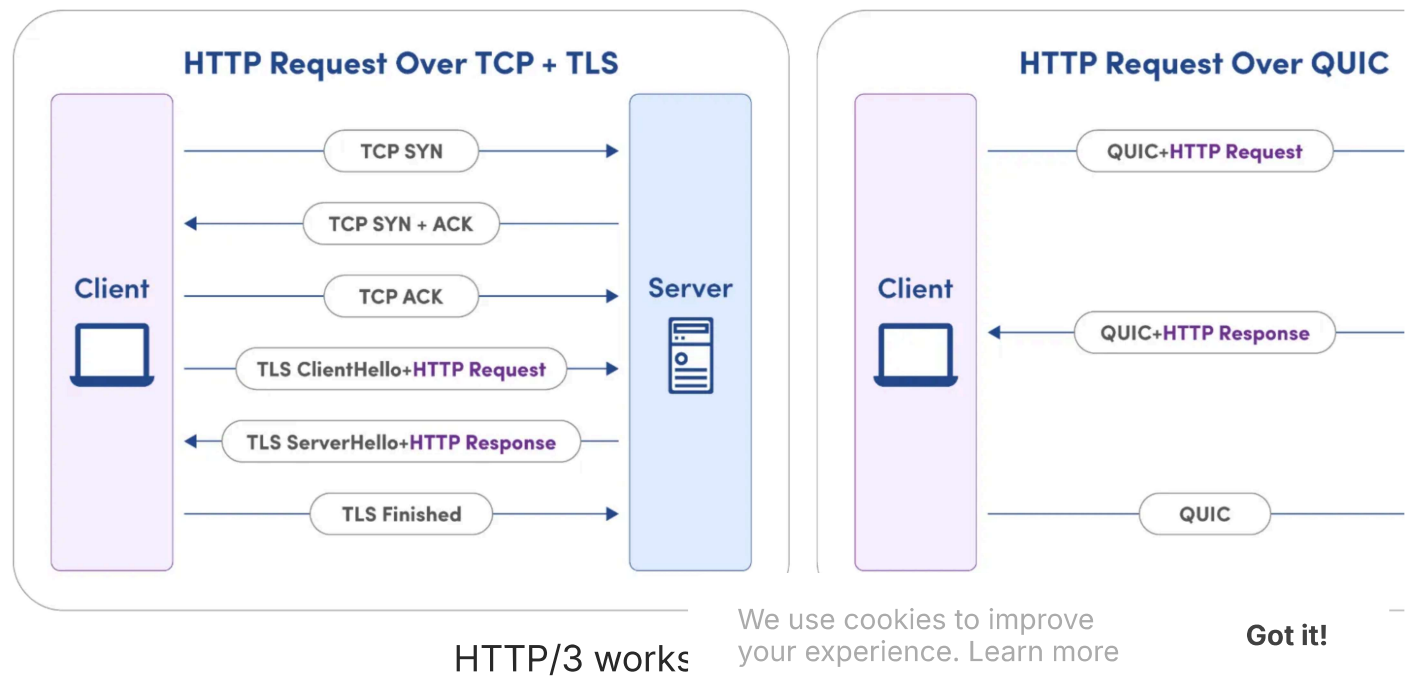

Got it!

Concept	Description
HTTP/3	HTTP/3 is the third and latest version of the Hypertext Transfer Protocol. It aims to reduce latency by enabling multiplexed connections and improving security and reliability over its predecessors.
QUIC	Quick UDP Internet Connections(QUIC) is the transport layer protocol that HTTP/3 is based on UDP instead of TCP.
NGINX	NGINX is an open-source web server that functions as a reverse proxy, load balancer, proxy, and HTTP cache. It is known for its rich feature set, simple configuration, and low resource consumption.

# NGINX HTTP/3 introduction

The history of HTTP began as a simple protocol for transferring hypertext document over the Internet, evolving through versions HTTP/1.0 to HTTP/2. However, these versions face challenges such as head-of-line blocking ([explained in Chapter 1](#)) and latency due to its reliance on TCP.

HTTP/3, the latest version, aims to overcome these limitations by adopting QUIC (Quick UDP Internet Connections), which uses UDP to reduce connection establishment time and improve congestion control. It allows for multiplexed streams without head-of-line blocking, setting a new standard for web communications.

**NGINX** is a web server created by Igor Sysoev in 2004 to solve the **C10k problem**—the challenge of handling ten thousand concurrent connections on a single server. It was designed to use an asynchronous, event-driven approach to managing requests, distinguishing it from the process or thread-based connection handling in traditional web servers like Apache.

Initially developed as a web server to serve static content efficiently, NGINX has since evolved for everything from load balancer/reverse proxy to API gateway and content caching.

NGINX's supports HTTP/3 through the ngx\_http\_v3\_module.

[Platform](#)

[Solutions](#)

[Pricing](#)

[Learn](#)

[Company](#)

[L](#)

## Check NGINX version

First, check your NGINX version. Support for QUIC and HTTP/3 has only been available since version 1.25.0.

We use cookies to improve your experience. [Learn more](#)

**Got it!**

```
nginx -v
```

You should see output similar to this:

```
nginx version: nginx/1.25.0
built with OpenSSL 3.0.2 15 Mar 2022
TLS SNI support enabled
configure arguments: --with-cc-opt='-g -O2 -ffile-prefix-map=/build/n
--lock-path=/var/lock/nginx.lock --pid-path=/run/nginx.pid
--with-http_v3_module --http-client-body-temp-path=/var/lib/nginx/bod
```

Optionally, you can also try:

```
nginx -V 2>&1 | grep -o with-http_v3_module
```

If you see with-http\_v3\_module in the output, your NGINX supports HTTP/3.

## Build NGINX with required modules

Download a version compatible with HTTP/3 and the QUIC patch from the official repository. 1.25.3 is the latest version as of the time of writing this. You can replace the version number with the latest version currently available for you.

```
wget http://nginx.org/download/nginx-1.25.3.tar.gz
tar -zxvf nginx-1.25.3.tar.gz
cd nginx-1.25.3
```

## Compile NGINX with HTTP/3 Support

A basic configuration command might look like this:

We use cookies to improve  
your experience. [Learn more](#)

**Got it!**

```
./configure \  
  --prefix=/etc/nginx \  
  --with-http_ssl_module \  
  --with-http_v2_module \  
  --with-http_v3_module \  
  --with-openssl=$QUICHE_DIR/deps/boringssl \  
  --with-quiche=$QUICHE_DIR
```

Adjust the `--prefix` and other options according to your requirements.

When configuring nginx, it is possible to enable QUIC and HTTP/3 using the `--with-http_v3_module` configuration parameter.

To build nginx, it is recommended that an SSL library that provides QUIC support, such as BoringSSL, LibreSSL, or QuicTLS, be used. Otherwise, the OpenSSL compatibility layer is used, which does not support early data.

Use the following command to configure nginx with [BoringSSL](#):

```
./configure  
  --with-debug  
  --with-http_v3_module  
  --with-cc-opt="-I../boringssl/include"  
  --with-ld-opt="-L../boringssl/build/ssl  
                -L../boringssl/build/crypto"
```

Alternatively, NGINX can be configured with [QuicTLS](#):

```
./configure  
  --with-debug  
  --with-http_v3_module  
  --with-cc-opt="-I../quictls/build/include"  
  --with-ld-opt="-L../quictls/build/lib"
```

Alternatively, NGINX can be configured with [LibreSSL](#):

We use cookies to improve  
your experience. [Learn more](#)

**Got it!**

```
./configure
  --with-debug
  --with-http_v3_module
  --with-cc-opt="-I../libressl/build/include"
  --with-ld-opt="-L../libressl/build/lib"
```

After configuring, compile and install NGINX:

```
make
sudo make install
```

After installation, you can verify HTTP/3 support by starting NGINX and checking its configuration or using tools that detect HTTP/3 support.

```
/path/to/nginx -V
```

Confirm `--with-http_v3_module` is contained in the output.

## Enable HTTP/3 in NGINX server block

An NGINX server block is a configuration unit within the NGINX web server that contains specific directives to define how to respond to requests for a particular domain or subdomain. Server blocks enable NGINX to process requests differently based on various request parameters.

Below, we give a basic example of server block configuration for HTTP/3.

```
server {
    # Listen on standard HTTP/2 and HTTPS ports
    listen 443 ssl http2;
    listen [::]:443 ssl http2;

    # Listen on UDP for QUIC+HTTP/3
    listen 443 quic reuseport;
    listen [::]:443 quic reuseport;
```

We use cookies to improve  
your experience. Learn more

**Got it!**

```
# Specify the key and certificate files
ssl_certificate /path/to/your/fullchain.pem;
ssl_certificate_key /path/to/your/privkey.pem;

# Specify the protocols including QUIC and HTTP/3
ssl_protocols TLSv1.3;
ssl_prefer_server_ciphers on;

# Add Alt-Svc header to advertise HTTP/3 support to clients
add_header Alt-Svc 'h3-23=":443"'; # Note: 'h3-23' denotes the dr

# Server root, index files, server name and other configurations
root /var/www/html;
index index.html index.htm;
server_name example.com;

...
}
```

## QUIC-specific security settings

Configuring security for NGINX is crucial for data integrity and trust. To optimize for HTTP/3, use OpenSSL 1.1.1 or later for TLS 1.3 support. You should also specify `ssl_protocols` and `ssl_ciphers` tailored for optimal performance and compatibility with HTTP/3.

```
# SSL optimizations for QUIC
ssl_protocols TLSv1.3; # Ensure only TLS 1.3 is used
ssl_ciphers [your-preferred-ciphers-for-TLS1.3];
```

## Advanced Configuratio

We use cookies to improve your experience. [Learn more](#)

Got it!

For more advanced setups, especially in high-traffic environments, consider tuning parameters like `ssl_session_cache`, `ssl_session_tickets`, and `ssl_session_timeout` to optimize TLS handshake times and overall server performance. We give an example below.

```
server {
    listen 443 ssl http2 default_server;
    listen [::]:443 ssl http2 default_server;
    listen 443 quic reuseport default_server;
    listen [::]:443 quic reuseport default_server;

    ssl_certificate /path/to/signed_cert_plus_intermediates;
    ssl_certificate_key /path/to/private_key;
    ssl_session_timeout 1d;
    ssl_session_cache shared:MozSSL:10m; # about 40000 sessions
    ssl_session_tickets off;

    # curl https://ssl-config.mozilla.org/ffdhe2048.txt > /path/to/dh
    ssl_dhparam /path/to/dhparam;

    # intermediate configuration
    ssl_protocols TLSv1.2 TLSv1.3;
    ssl_ciphers ECDHE-ECDSA-AES128-GCM-SHA256:ECDHE-RSA-AES128-GCM-SHA256
    ssl_prefer_server_ciphers off;

    # Enable QUIC and HTTP/3
    ssl_quic on;
    ssl_early_data on;
    add_header Alt-Svc 'h3=":$server_port"; ma=86400';

    # HSTS (ngx_http_headers_module is required) (63072000 seconds)
    add_header Strict-Transport-Security "max-age=63072000" always;

    # OCSP stapling
    ssl_stapling on;
    ssl_stapling_verify on;
```

We use cookies to improve  
your experience. Learn more

**Got it!**

```
# verify chain of trust of OCSP response using Root CA and Intermediate  
ssl_trusted_certificate /path/to/root_CA_cert_plus_intermediates;  
  
# replace with the IP address of your resolver  
resolver 127.0.0.1;  
  
}
```

Remember, the above configurations are a starting point. Monitoring and adjusting configurations based on performance data is crucial. Identifying bottlenecks and understanding how different settings impact user experience across various global locations are critical for a successful deployment.

# Troubleshooting tips for NGINX HTTP/3

If you run into configuration issues, consider the following.

## Debug SSL/TLS misconfiguration

Tools like OpenSSL can help you inspect SSL certificates and test the SSL handshake.

We use cookies to improve  
your experience. [Learn more](#)

**Got it!**

```
openssl x509 -in /path/to/cert.pem -text -noout
```

This command displays the details of your certificate to verify its validity.

```
openssl s_client -connect yourserver.com:443 -alpn h3-29
```

Replace h3-29 with the appropriate HTTP/3 version supported by your server. This tests the SSL handshake and shows if HTTP/3 negotiation occurs.

## Debug QUIC protocol issues

If you're developing or debugging applications using QUIC, [quic-go](#) (a QUIC implementation in Go) provides logging capabilities to trace QUIC protocol operations. You can also use [Wireshark](#) to capture and analyze QUIC traffic. For a quick command-line check, you can use `tcpdump`.

```
sudo tcpdump -i any -U -w quic_traffic.pcap 'udp port 443'
```

This captures UDP traffic on port 443 and saves it to a file for later analysis. Remember that decrypting QUIC traffic requires the SSL/TLS keys because of QUIC's built-in encryption.

## Review NGINX logs

Always check NGINX's error logs for clues on what might be going wrong. They can point you directly to the source of the problem.

```
tail -f /var/log/nginx/error.log
```

Remember, when modifying NGINX configurations or firewall rules, make incremental changes and test each step to isolate the cause of any issues.

Another consideration is the relatively new state of HTTP/3 support across clients and networks; while major browsers support it, not all do by default. Some enterprise networks have not yet been optimized for UDP traffic associated with HTTP/3.

We use cookies to improve your experience. [Learn more](#)

**Got it!**

# Best practices for NGINX HTTP/3 configurations

Best practices for deploying NGINX with HTTP/3 are given below.

## Include TLS 1.3 in configurations

Include enabling TLS 1.3, as QUIC requires. Make sure these lines appear in your configuration shown in the example above:

```
# Enable QUIC and HTTP/3
http3 on;
ssl_early_data on;
add_header Alt-Svc 'h3=":$server_port"; ma=86400';
```

Additional configuration options can be found in the official [documentation](#) for NGINX.

## Check firewall and network configuration

Ensure your firewall allows UDP traffic on port 443. You can use iptables or ufw on Linux to check and modify firewall rules.

```
sudo iptables -L -v -n
```

Example with ufw.

```
sudo ufw status
```

Look for firewall rules allowing or blocking UDP traffic on port 443, and adjust accordingly. Ensure there's an allow rule for 443/udp.

## Implement phased rollo

We use cookies to improve your experience. [Learn more](#)

Got it!

Test your HTTP/3 setup in a staging environment before rolling it to production. This to identify and resolve any compatibility or performance issues.

Additionally, the impact on SEO and user analytics should be considered, as the shift may affect metrics collection and analysis. To mitigate potential issues, employ a plan and monitor performance and user feedback closely.

It's also important to stay abreast of [NGINX news and updates](#), as improvements and related to HTTP/3 are continually being released.

## Performance optimization

Performance optimization for HTTP/3 on NGINX focuses on minimizing latency and increasing throughput. This can involve tuning the underlying UDP settings for QUIC, adjusting buffer sizes, and optimizing TLS configuration to reduce handshake time. Monitoring and changing settings based on real-world usage patterns are crucial, as the requirements can vary significantly depending on specific traffic loads, content type, and network conditions.

In this context, the [Catchpoint platform](#) can provide deep visibility into every aspect of the Internet

application performance monitoring, but not for your app stack—for your Internet Stack. Catchpoint provides over 40 out-of-the-box monitors and the world's largest global observability network to test and monitor all your Internet Stack components, including backbone, wireless, edge, and cloud nodes.

Catchpoint also provides real user monitoring to track users' actions while engaging with a website or application. It provides accurate data and metrics to better understand user behavior and insight into a system or service's performance. With Catchpoint's support, businesses can ensure that their transition to HTTP/3 enhances performance and security and aligns with the best user experience outcomes.

## Final thoughts

NGINX support for HTTP/3 is indicative of the coming era in global Internet operations. Encourage users to take advantage of HTTP/3's benefits, including reduced latency, improved security, and better handling of multiple data streams.

However, given the early stages of adoption, ensure you test your changes thoroughly before deploying to production. Monitoring network usage will allow you to optimize your application configuration changes.

## What's Next?

### Introduction

Learn how HTTP/3 improves over HTTP/2 in multiplexing, connections, security, error handling, etc., to improve web communication, performance, and user experience.
